Bridging the Communication Gap is a book about improving communication between customers, business analysts, developers and testers on software projects, especially by using specification by example and agile acceptance testing. These two key emerging software development practices can significantly improve the chances of success of a software project. They ensure that all project participants speak the same language, and build a shared and consistent understanding of the domain. This leads to better specifications, flushes out incorrect assumptions and ensures that functional gaps are discovered before the development starts. With these practices in place you can build software that is genuinely fit for purpose.

Mending Nazi Uniforms

In the 1980s, a research team led by Parisian scientists identified several unique DNA sequences, or haplotypes, linked to sickle cell anemia in African populations.

After casual observations of how patients managed this painful blood disorder, the researchers in question postulated that the Senegalese type was less severe. The Enculturated Gene traces how this genetic discourse has blotted from view the roles that Senegalese patients and doctors have played in making sickle cell "mild" in a social setting where public health priorities and economic austerity programs have forced people to improvise informal strategies of care. Duana Fullwiley shows how geneticists, who were fixated on population differences, never investigated the various modalities of self-care that people developed in this context of biomedical scarcity, and how local doctors, confronted with dire cuts in Senegal's health sector, wittingly accepted the genetic prognosis of better-than-expected health outcomes. Unlike most genetic determinisms that highlight the absoluteness of disease, DNA haplotypes for sickle cell in Senegal did the opposite. As Fullwiley demonstrates, they allowed the condition to remain officially invisible, never to materialize as a health priority. At the same time, scientists' attribution of a less severe form of Senegalese sickle cell to isolated DNA sequences closed off other explanations of this population's measured biological success. The Enculturated Gene reveals how the notion of an advantageous form of sickle cell in this part of West Africa has defined--and obscured--the nature of this illness in Senegal today. ASIS Thesaurus of Information Science and Librarianship

The ASIS Thesaurus covers the fields of information science and librarianship. Related and peripheral fields, such as computer science linguistics, and behavioral and cognitive sciences, are examined as warranted by the strength of their relationship to information science and librarianship. More limited coverage of

other peripheral fields, such as education and economics, is also provided. The thesaurus is intended primarily as a resource to aid in indexing and searching within the fields of information science and librarianship. It has also been designed for students and researchers to serve as a guide to the terminology of the field. The scope of the thesaurus is limited mainly to topical subjects. Proper names of organizations, programs, etc., are excluded, and only the names of a few tools which are key to indexing and cataloguing practices are included. The thesaurus includes 1,316 preferred terms (descriptors), 691 nonpreferred terms (user references), and 37 facet indicators. Scope notes provide information about the use of terms in the thesaurus, as well as definitions of ambiguous terms. The thesaurus can be used in three different ways: an alphabetical listing provides the full record for each descriptor, including its BT, NT, RT, and UF references; a hierarchical listing shows each descriptor in its place(s) in the hierarchy of terms based on BT/NT relationships; and a rotated (KWIC) listing shows each descriptor in alphabetical order by every word appearing in the term.
