Introduction to Sport Marketing is an accessible and engaging introduction to key concepts and best practice in sport marketing. Aimed at students with little or no prior knowledge of marketing, the book outlines a step-by-step framework for effective sport marketing, from conducting market analysis and developing a strategy, through to detailed planning and implementation. The book has a wider scope than other sport marketing textbooks, recognising that students are just as likely to have to employ their marketing skills in community sport or the not-for-profit sector as in professional sport, and therefore represents the most realistic and useful sport marketing text currently available. Now in a fully revised and updated second edition, the book has expanded coverage of digital and social media, product innovation, services and relationship marketing, and key contemporary issues such as social responsibility and sustainability. It features a much wider range of international cases and examples, covering North America, Europe, and the vibrant and rapidly developing sport markets in Asia-Pacific, the Middle East and Latin America. Every chapter includes a range of useful features to help the reader to engage with fundamental principles and applied practice, such as problem-solving exercises and review questions. Introduction to Sport Marketing is an essential textbook for any degree-level sport marketing course.

Consumer Behavior

The goal of machine learning is to program computers to use example data or past experience to solve a given problem. Many successful applications of machine learning exist already, including systems that analyze past sales data to predict customer behavior, optimize robot behavior so that a task can be completed using minimum resources, and extract knowledge from bioinformatics data. Introduction to Machine Learning is a comprehensive textbook on the subject, covering a broad array of topics not usually included in introductory machine learning texts. Subjects include supervised learning; Bayesian decision theory; parametric, semi-parametric, and nonparametric methods; multivariate analysis; hidden Markov models; reinforcement learning; kernel machines; graphical models; Bayesian estimation; and statistical testing. Machine learning is rapidly becoming a skill that computer science students must master before graduation. The third edition of Introduction to Machine Learning reflects this shift, with added support for beginners, including selected solutions for exercises and additional example data sets (with code available online). Other substantial changes include discussions of outlier detection; ranking algorithms for perceptrons and support vector machines; matrix decomposition and spectral methods; distance estimation; new kernel algorithms; deep learning in multilayered perceptrons; and the nonparametric approach to Bayesian methods. All learning algorithms are explained so that

students can easily move from the equations in the book to a computer program. The book can be used by both advanced undergraduates and graduate students. It will also be of interest to professionals who are concerned with the application of machine learning methods.
