Practical Treatise on the Diseases of Children

This book encourages health professionals to reconceptualise their practice in the light of the fact that their patients are deteriorating and dying, supporting them in their dichotomous role which involves affirming that person's life whilst acknowledging that that life is ending. Professionals are encouraged to think laterally, to be creative in their use of their core skills, and to use their life skills and experience to change the focus of their interventions. By making these

changes, those involved with caring for the dying will be able to address issues related to burnout and feeling de-skilled. The authors share their considerable experience with the reader - what works for both patient and carer/professional when working in this field. By providing workable solutions, they empower those in disempowering situations, such as when working with terminally ill children and adults. The book is truly holistic and client-centred in its approach, upholding the philosophy of palliative care. Aimed at all who interact with children and adults who have a life-limiting condition or who are dying Offers practical examples of approaches to dilemmas and emotional issues commonly face by those working in palliative care Encourages professionals to think laterally, to be creative in their use of core skills, and to use their life skills and experience to change the focus of their interventions Moves the emphasis away from the medical model to the emotional and spiritual influences on quality of life Offers clear, workable guidelines and demonstrates practical solutions, based on proven theory and experience, to problems encountered on a day-to-day basis by patients and those coming into contact with them

Practical Treatment Options for Chronic Pain in Children and Adolescents

Advances over the past two decades have enabled physicians to revolutionize the manner in which they can assess and manage children's pain. Thirty years ago it was thought that young children did not experience pain and therefore it was not necessary to treat it. Today professionals from a variety of disciplines have contributed data that have revolutionized medical perspectives. Technological advances now enable doctors to treat acute pain in fetuses, premature neonates, infants, toddlers, children, and adolescents with increasing precision and efficacy. Research highlighting the context of chronic pain has moved them away from a mind-body dichotomy and toward an integrated, holistic perspective that leads to substantial improvement in children's adaptive functioning as well as subjective discomfort. This book covers these topics and is intended for anyone who provides medical care to children. Each chapter provides an overview of the problem, followed by a "hands on" description of relevant assessment and intervention strategies. The role of the primary care practitioner is highlighted, both as a front-line resource as well as a consumer of specialized pediatric pain treatment services. Each chapter ends with a summary and specific bullet points highlighting the most central elements, making for quick and easy reference.

A Practical Approach to Orthopaedic Medicine

Most physicians entering the field of pediatric cardiology are drawn to it by an interest in the wide variety of congenital heart defects which present at various ages. Most congenital heart disease will be evident in early life, presenting with cyanosis, heart murmur, congestive heart failure or shock. Textbooks in pediatric cardiology are filled overwhelmingly with chapters on the various congenital heart lesions which are encountered, both rare and common. However, practicing pediatric cardiologists will be quick to point out that a significant number of referrals to any practice do not involve congenital heart problems. Reviewing our own statistics at the Children's Hospital of Michigan Cardiology Center for the past two years (2010-2012) reveals that outpatient visits for new patient consultations examined by age groups are: less than 1 year of age - 11%; 1-5 years - 23%; 6-10 years - 21%; 11-18 years - 45%. Retrospective data collected from billing codes, as in this brief survey, may imprecise. However, it does provide a snapshot of the usual referral problems encountered by pediatric cardiologists. In our practice, the most common overall reason for referral in all ages was "heart murmur",

constituting 26% of total referrals. Second were rhythm and rhythm related problems (inclusive of palpitations, abnormal ECG and diagnosed premature beats) constituted 19% of the total. In the age group of interest for this book of 11-18 years, the most common presenting issues were rhythm related (23%) and chest pain (23%), followed by syncope or dizziness (19%) and heart murmur (12%). Congenital heart disease diagnoses encountered in the 11 to 18 year age group comprised only 6.5% of referrals within that age group. It is likely that many of these were not new diagnoses (with a few exceptions), but rather represented transfers to our practice. Our own outpatient clinical experience reveals that the majority of outpatients referred by pediatricians for pediatric cardiology evaluation are between the ages of 11 and 18. The majority of these new referrals are not for congenital heart disease. Our intent for this edition of Pediatric Clinics of North America is to describe the types of problems which seem to be of concern to the pediatric community within this age group and to describe strategies for evaluation.
