Postural headaches following interventions that disrupt meningeal integrity are most commonly labeled postdural puncture headaches (PDPHs). This terminology has been officially adopted in the International Classification of Headache Disorders and is used in this chapter. However, use of the word postdural has been criticized as confusing and probably inaccurate, resulting in the proposal of an

of the observation period, so the actual survival times for some patients are unknown. This phenomenon, referred to as censoring, must be accounted for in the analysis to allow for valid inferences. Moreover, survival times are usually skewed, limiting the usefulness of analysis methods that assume a normal data distribution. As part of the ongoing series in Anesthesia & Analgesia, this

x A 180° anterior (Dor) fundoplication is usually paired with an esophagogastric myotomy in the surgical treatment of achalasia. The traditional technique, however, is not easily reversible and the execution is variable. We present a simplified “three stitch” Dor fundoplication that addresses these challenges and discuss our results.
